TAU - decentralized messenger

**Bring high-scaling blockchain-coins economy
into every community**

Killer app
Decentralize messenger with community economy

- A chat app "similar" to Telegram or WeChat interface with a *bit* more …

  - Server-less: smart phones form social network independent from any central server.

  - Blockchain coins circulation: each community will issue FIXED 10 million crypto-coins, through which members make trades, services and advertisements.

  - Parallel: there could be millions of community independent from TAU.

- Initial users are torrent video sharing fans.

Each community has value.
Discovering social value through transparent coins circulation

- Any group of digitally connected people has potential value.

- Fixed amount of crypto-coins issued in the group will discover such potential.

- The more loyal members join, the higher total wealth a community achieves.

- When a commonwealth created, higher quality content and service evolves.

- A economy with coins circulation will happen.

Technology gap
Missing decentralized and permission-less communication technology

- "Big Tech", such as Amazon, Uber and YouTube, are centralized with deletion power over users. Such power also exists in traditional group admins.

- Web and app servers restrict data transparency and community financial independence.

- Low scaling of state-of-art crypto coin technologies ranging from BTC to EOS are not feasible for global consumer use.

TAU enables a server-less, permission-less, mobile independence, high scaling parallel blockchain tech stack.

- Communication is the core for every digital application in messengers, Uber, Priceline or Amazon, etc.

- Only a pure permission-less decentralized communication brings real uncensored blockchain economy.

- Features required - no server, everyone can join permission-lessly, open source, open data, unlimited scale in blockchain transactions.

- Core technology innovation

  - Distributed Hash Table - TAU DHT multi-level cache overlay communication protocol

  - Peer to Consensus - Proof of Transaction as blockchain consensus

  - Full mobile device computing and networking

Team and privacy

Due to nature of the product, we do not disclose team members here.

- Technology skills

  - Big data and cryptographic processing

  - Telecom and mobile phone expertise

  - Blockchain consensus research

  - Java, c++ and android dev

- Business experiences

  - NYSE and Nasdaq listed tech companies founder

  - Committed long term mindset

  - 50 global telegram groups administrators with quarter million user registration
